

Tendaflow

Procurement System User Guide

Draft for review and expansion

Version	Review Draft
Generated	18 June 2026
Purpose	Use this draft to review missing workflows, clarify wording, and build the final in-app guide and Tenda Assistant knowledge base.

Table of Contents

1. Getting Started
2. Business Types
3. Departments
4. Roles and Permissions
5. Approval Workflows
6. Suppliers and Supplier Import
7. Purchase Requisitions
8. Purchase Orders
9. Invoices
10. Payments
11. Exchange Rates
12. Reports
13. Audit Logs
14. Tasks and Notifications
15. Supplier Portal

How To Review This Draft

Read this guide as a user would: from setup, to creating records, to approvals, reporting, and supplier portal use. Mark any step that feels unclear, missing, or different from the actual system behavior.

Recommended review notes:

- Where should screenshots or diagrams be added?
- Which pages need more precise button names?
- Which permissions or roles need clearer examples?
- Which questions should Tenda Assistant answer directly?
- Which warnings should appear in the user guide only?

1. Getting Started

Company owners and administrators.

Set up Tendaflow in the right order so procurement, approvals, reports, and supplier records work cleanly.

Key Steps

- 1 Confirm the company profile and business type.
- 2 Create departments for teams, branches, or cost centres.
- 3 Review the default roles before creating new ones.
- 4 Procurement-style roles are prepared to create procurement work such as PRs and POs.
- 5 Finance-style roles are prepared to create finance work such as invoices and payments.
- 6 Assign permissions carefully when a role needs extra access beyond the default setup.
- 7 Configure approval workflows for PRs, POs, invoices, and payments.
- 8 Add suppliers and exchange rates before creating live procurement records.

What To Watch For

Start from this guide if you are unsure what to do first.

Do not give approval permissions to users who should only request items.

Test workflows with a small record before relying on them in production.

2. Business Types

Company owners and administrators.

Business type helps Tendaflow support one-person businesses, partnerships, and larger companies.

Key Steps

- 1 Use Sole Proprietorship for a one-person shop where the owner can approve alone.
- 2 Use Partnership when partner approval rules need to be configurable.
- 3 Use Company for larger teams with departments, roles, and multi-level approval workflows.
- 4 For partnerships, configure partner approval options inside each approval workflow.

What To Watch For

Partnership approvals are configurable and not limited to exactly two people.

Approval workflows still control the actual approval route.

3. Departments

Admins and company owners.

Departments organise users, procurement records, approvals, and reports by team or cost centre.

Key Steps

- 1 Open Departments from the sidebar.
- 2 Create a department with a clear name.
- 3 Assign users to departments where required.
- 4 Use departments when creating PRs, POs, and workflow levels.

What To Watch For

Approvers may need to belong to the same department as the workflow level.

Use consistent department names for cleaner reporting.

4. Roles and Permissions

Admins and company owners.

Roles group users by responsibility. Permissions decide what each role can view, create, update, approve, export, or administer.

Key Steps

- 1 Review the default roles before creating new roles.
- 2 Procurement-style roles are intended to create PRs and POs.
- 3 Finance-style roles are intended to create invoices and payments.
- 4 Create roles such as Requester, Procurement Officer, Finance, Partner, Approver, or Admin.
- 5 Open Permissions and assign only the actions each role needs.
- 6 Assign users to the correct roles.
- 7 Test access with a real user account before using the workflow in production.

What To Watch For

Default creation permissions help teams start faster, but they should still be reviewed.

Permissions such as `pr.create` and `pr.approve` mean very different things.

Avoid giving admin permissions to everyday procurement users.

5. Approval Workflows

Admins and company owners.

Approval workflows define who approves PRs, POs, invoices, and payments, and in what order.

Key Steps

- 1 Open Approval Workflows.
- 2 Choose the workflow for PR, PO, invoice, or payment.
- 3 Add workflow levels in the order approvals should happen.
- 4 Assign approver roles to each level.
- 5 For partnerships, configure partner approval mode if needed.

What To Watch For

A workflow without levels cannot process approvals.

A level without assigned roles cannot be approved.

Users should watch the Tasks icon and notification bell for pending approvals.

6. Suppliers and Supplier Import

Procurement teams, admins, and users creating POs.

Suppliers store vendor details, categories, contact information, location, and supply history.

Key Steps

- 1 Open Suppliers.
- 2 Add one supplier manually or use Import Excel for bulk upload.
- 3 Use headers such as name, email, phone, address, contact_person, category, and sub_category.
- 4 Choose a category or select Other and enter a custom category.
- 5 Use the More button to review contact details and recent supplied items.

What To Watch For

Good supplier categories improve PO supplier selection and reports.

Avoid duplicate supplier names.

Keep contact details updated for follow-up.

7. Purchase Requisitions

Requesters, department users, procurement teams, and approvers.

A PR captures what a user needs before procurement creates or issues a PO.

Key Steps

- 1 Open Purchase Requisitions.
- 2 Click Create PR.
- 3 Add title, department, business reason, items, quantities, prices, and currency.
- 4 Save the draft and review totals.
- 5 Submit for approval when ready.

What To Watch For

Use realistic estimated prices.

Check the Tasks icon and notification bell after submission if you are an approver.

8. Purchase Orders

Procurement teams and PO approvers.

A PO confirms the supplier, items, quantities, and agreed pricing for procurement.

Key Steps

- 1 Open Purchase Orders.
- 2 Create a PO directly or create one from an approved PR.
- 3 Use the supplier picker to search by supplier, category, contact, or supplied items.
- 4 Review item quantities, unit prices, totals, department, currency, and notes.
- 5 Submit for approval when ready.

What To Watch For

Create PO from approved PR where possible for traceability.

Review suggested suppliers before selecting one.

9. Invoices

Finance users, procurement teams, supplier portal users, and invoice approvers.

Invoices record what the supplier bills and should be checked against the PO and delivered items.

Key Steps

- 1 Open Invoices.
- 2 Create an invoice and link it to the supplier and PO where applicable.
- 3 Confirm invoice number, item descriptions, quantities, prices, totals, currency, and dates.
- 4 Submit for approval when ready.
- 5 Approvers review from Tasks, Approvals, or notification alerts.

What To Watch For

Do not approve invoices that do not match the PO or received items.

Check outstanding invoice reports for unpaid balances.

10. Payments

Finance users and payment approvers.

Payments record money paid against approved invoices and update invoice payment status.

Key Steps

- 1 Open an approved invoice.
- 2 Create a payment from the invoice.
- 3 Enter amount, payment method, reference, currency, and date.
- 4 Review outstanding balance before saving or submitting.

What To Watch For

Do not overpay an invoice.

Use references that can be traced to bank or mobile money records.

11. Exchange Rates

Finance users and admins.

Exchange rates convert foreign-currency procurement records into base currency for reporting.

Key Steps

- 1 Open Exchange Rates.
- 2 Add or update the currency rate and effective date.
- 3 Use the currency on PRs, POs, invoices, or payments.
- 4 Review base-currency totals in reports.

What To Watch For

Use accurate rates before creating foreign-currency records.

Review exchange rate date for audit clarity.

12. Reports

Managers, finance users, admins, and auditors.

Reports summarise procurement activity, spend, outstanding invoices, payments, supplier spend, and lead time.

Key Steps

- 1 Open Reports.
- 2 Choose the report tab.
- 3 Apply filters such as date, status, supplier, department, payment method, or supplier category.
- 4 Review summary cards and table values.
- 5 Export CSV or Excel when needed.

What To Watch For

Supplier category improves supplier spend analysis.

Exported reports should be treated as sensitive business records.

13. Audit Logs

Admins, auditors, and company owners.

Audit logs show who did what, when, and on which record for accountability.

Key Steps

- 1 Open Audit Logs.
- 2 Review user actions, record references, dates, and details.
- 3 Use logs to investigate setup changes, approvals, supplier updates, and report exports.

What To Watch For

Audit logs are for traceability, not editing business records.

Unexpected actions should be reviewed promptly.

14. Tasks and Notifications

Approvers, procurement teams, finance users, and admins.

Tasks and notifications help approvers find work that needs their attention.

Key Steps

- 1 Watch the Tasks icon for pending approval work.
- 2 Check the notification bell for approval alerts.
- 3 Open the task or notification to review the related record.
- 4 Approve or reject only after checking the details.

What To Watch For

A missing task may mean the workflow level, department, or role assignment needs checking.

Approvers must use their own account for accountability.

15. Supplier Portal

Admins, procurement users with supplier update access, external supplier users, and internal teams reviewing supplier submissions.

The supplier portal lets internal users create controlled supplier access, while external suppliers view POs, create invoices from eligible POs, and track invoices or payments.

Key Steps

- 1 Open Suppliers in the internal Tendaflow workspace.
- 2 Create the supplier first if the supplier does not already exist.
- 3 Open the supplier record and go to the Portal Users section.
- 4 Enter the supplier user's email address and create the portal user.
- 5 Tendaflow emails the supplier a setup link so they can create their password.
- 6 After setup, the supplier signs in through Supplier Login.
- 7 The supplier can view assigned purchase orders, create invoices from eligible POs, and track invoices or payments.
- 8 Internal users review submitted supplier invoices in the main workspace.

What To Watch For

Only admins or users with supplier update access can manage supplier portal users.

Use the supplier's correct email address because the setup link is sent there.

If the setup link expires or is lost, resend the setup link from the supplier's Portal Users section.

You can activate or deactivate supplier portal users from the same Portal Users section.

Supplier portal users should only access their own records.

Internal invoice approval still happens in the main workspace.

Review Notes

Use this page to list additions before we update the in-app guide and Tenda Assistant.
